

Build Tip: Changing or Entering Text for a Group of Findings

President's Corner

In this industry, change is rapid and relentless. Do you find it overwhelming to keep up with everything? ICD10, upgrades, attestation, HIE's, ACO's...the list goes on and on.

Here at EHR Concepts we are working around the clock to make sure that we are your one stop shop for

Did you know that you do not have to open each properties box just to change or enter text for a group of findings?

In the example below, each section is linked to its own heading on the left, but the Display Name and Positive/Negative text of the findings are the same. Instead of opening and closing each individual finding and correcting the text, you can open the Form Bulk Properties screen and correct them all from there. You have the option to type each one individually, or type the first section and then copy and paste the text into the others. You would copy the text from each field in the red boxes into the corresponding field in the green circles.

Highlight: Live Chat

With EHR Live Chat
Support, help is at your
fingertips. Let Live Chat
assist your EHR users
immediately via remote chat
sessions, right on the user's
computer screen. EHR
users can chat with
helpdesk staff, instead of
submitting a support ticket.
Also, to help them resolve
similar issues in the future,
users can access recorded
Live Chat transcripts for
reference. Help is just a
keystroke away.

Meaningful Use: Patient Education

Providing patient education is now a core measure for MU2. So what options do you have? You actually have quite a few!

Included as part of the MU Package is the Info Button functionality which gives you access to education from Medline Plus within the application. You can also use instructions or precautions, but they **must be** ordered from Careguides, Quick Sets or Order Groups in order to count toward this measure. Drug Ed and Careguide monographs are still available and they both count toward this as well. Lastly, you can check "Vaccine Information Statement Provided..." when administering vaccines to get credit for this measure.

In order to ensure that you meet the threshold, figure out which of the options above would be most intuitive to your current workflows, and start training your users now! You can also help your users by adding commonly used

[Live Chat](#)

instructions to Order Groups or Careguides to ensure they will count toward the measure.

Interface Tip: Re-bundling Messages

Recently, we helped a client who had an issue with "re-bundling" messages from their lab system. The client would receive a lab, the provider would verify it, and then the lab would re-bundle that result with a new one. This forced the provider to re-verify the message, ultimately duplicating work. We came up with a simple script using the Clinical date, OrderCode, Result Code, ResultStage, the actual result answer, as well as patient matching criteria, to determine if the result was part of a re-bundled message or a new result. If your providers are consistently duplicating work by re-verifying previously verified results, please contact us for assistance.
